Run-time error (#62)  
===== An error is a message which comes at runtime or when a program is starting to execute. An error occurs when a program is running a code or doing something that should be avoided by the programmer. This program is executed in the order of execution or execution path. This means that an error occurs when a program is running and it tries to execute a function or instruction that does not exist. The function should not exist as it is an illegal or abnormal function. When an error occurs, a program may have to stop running in order to help the user fix the error, before the program is used again. A runtime error is an error that occurs at runtime or when a program is being run or started. A runtime error is usually the result of a bug in the program that is being executed. A program can have several runtime errors. A runtime error may affect any of the subsystems of the computer, such as an application, operating system, or a hardware device. These problems are usually caused by some code or instruction that does not work the way it should. A runtime error usually occurs when a program is running and it tries to execute a function or instruction that does not exist. No other program can be run without a correct and safe runtime error. This error may be fatal to the system and it can also be very annoying. However, for Windows users, this error does not usually pose any danger. But, it can also be very irritating to the end user because of the following reasons: 1. It may affect any of the subsystems of the computer, such as an application, operating system, or a hardware device. 2. It may affect the program or it can occur on the computer. 3. It may affect the end user of the computer. 4. It may 82157476af
